IoT solutions
for Industrial automation

The final scope of the Ericsson-Comau project is to enable a secure and reliable **wireless network** for monitoring and control purposes. Sensors data from robots and plant will be processed in **cloud** in real time, also applying big data **analytics** functionalities to provide feedback to the customers for preventive maintenance.

1 Wired connectivity replacement

Legacy wired connectivity between sensors, controllers (PLCs) and actuators will be replaced by 5G.

2 Remote Virtual Control (PLC)

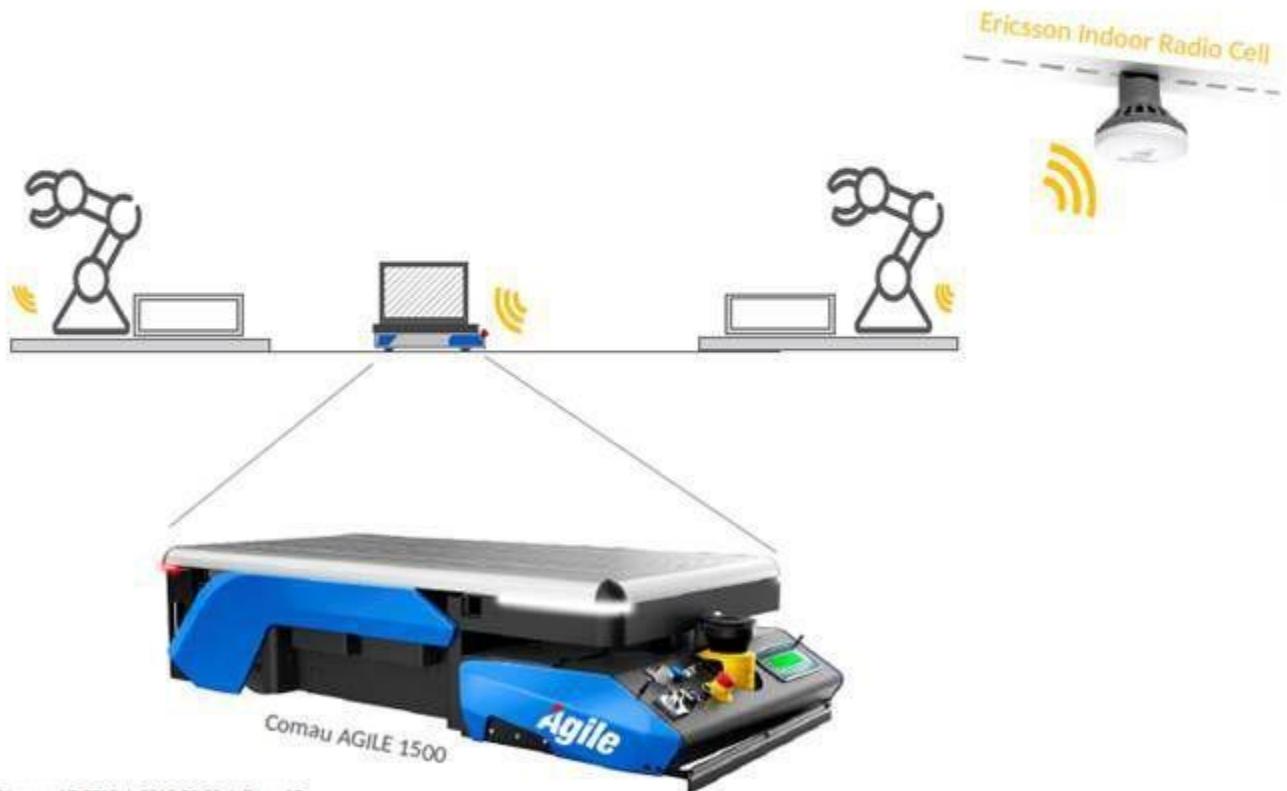

Control logic over wireless and deployed on a cloud-platform:

- Easier implementation of new control features
- No new PLC hardware is needed when new actuators are deployed
- Deployment of different level of control functions on the same platform: factory, cell, actuator level
- Cooperative device control is possible

Autonomous vehicles are one of the key tools meeting the Factory of the Future's needs, such as growing demand of flexibility, re-configuration and minimal use of resources in production systems.

e.DO

Educational robotics

Comau e.DO is a unique, modular, open-source, Industry 4.0-enabled, “build-it-yourself” robot kit created for anyone who wants to explore or expand the world of robotics.

As an open-source project, the hardware and software structure is designed to encourage application sharing and expansion via the future community and program new coding directly into the robot itself.
